Quick Changeover/Setup Reduction Workshop

“Increase machine capacity while reducing setup time and costs”

Quick changeover through the Single Minute Exchange of Dies system (SMED) forms the basis of setup reduction. Participants in this one-day workshop engage in hands-on simulation to learn the principles of the SMED system, developed by Shigeo Shingo. By applying a four-step changeover improvement process to the simulated environment, participants are able to design no/low-cost solutions that reduce changeover time. At the end of the day, they will have firsthand knowledge of how applying SMED principles can increase machine capacity while reducing costs and setup times.

This Workshop is conducted using lecture with a slide presentation and workbooks for each participant. There is ample time for discussion and interaction with a question and answer session.

Upon completion of the Quick Changeover Workshop participants will:

- Understand the principles of setup reduction.
- Know the standard methodology for applying SMED to any type of setup or industry.
- Be able to identify and overcome barriers to reducing setup time.

“Great workshop! Through this we were able to see that effective communication and teamwork, plus brainstorming on how to improve operations are the keys to success”
